

Explain biodiversity Define and explain the different types. Why is it so important?	What are ecosystem services? What do they provide?
What is a keystone species? Why are they important? Provide examples.	What is CHIPPO? How does each threaten biodiversity?
What are a few causes of habitat loss? What is habitat fragmentation? How does it reduce biodiversity? What are wildlife corridors? What do they do?	What factors determine the change in a population? Describe the models for population growth.

Draw a carrying capacity graph

Explain the graph

What would affect the carrying capacity of an ecosystem? Do populations always stay at their carrying capacity? What are some examples of limiting factors?

What **extreme** changes can destabilize populations and ecosystems? How does this happen?

What is Earth Overshoot day, and why does it typically change every year?

Hint - What does biocapacity mean?
